

In order for a concurrent-user license to work correctly, **four components** need to be in place. These components include the basic application installation, `licenceServer.ini`, PQ Systems License Manager, and a license file.

Client-side components

- **Basic application installation** - The software program (*CHARTrunner*, *SQCpack*, or *GAGEpack*) must be installed on the client computer.
- **licenceServer.ini** - This file tells the program that it needs to communicate with the server to get permission to run. It must be slightly modified from its original version in order to work correctly. Open the file in Notepad and follow the instructions listed. **licenceServer.ini** must be saved in the same directory as the application.

Server-side components

- **PQ Systems License Manager** - This application handles the traffic from all of the clients. When it is contacted by a client, it grants or denies permission to launch based on how many other users (clients) are currently running the program. The PQ Systems License Manager must be installed on a network server that is accessible by all of the client computers.
- **License file** - When a concurrent-user license is purchased, PQ Systems will generate a license file. This file tells the PQ License Manager how many instances of a program are allowed to run simultaneously. The file needs to be saved in the same directory as the **PQ Systems License Manager**.

Where to find these components

- 1) The software program can be downloaded directly from the PQ Systems website:
<http://www.pqsystems.com/support/SoftwareUpdates.php>
- 2) The PQ Systems License Manager can be downloaded directly from the PQ Systems website:
<http://www.pqsystems.com/concurrent>
- 3) After the PQ Systems License Manager has been installed, you will find a copy of the `licenceServer.ini` in the installation directory you selected. (Refer to client-side components `licenceServer.ini`.)
- 4) The license file is sent from PQ Systems. If you have not received it or have misplaced it, contact PQ Systems. The license file needs to be saved in the same directory as the **PQ Systems License Manager**.

How to turn it on

Once all four components are in place, open a web browser on the server where PQ Systems License Manager is installed.

In the URL bar, type: **http://localhost:5054**

Click **Reread/Restart Servers** from the list of commands.

Click **REREAD/RESTART** on the next page.

The concurrent-user license should now be up and running. To test it, launch the program (*CHARTrunner*, *SQCpack*, or *GAGEpack*) from a client computer. Once the program is open, go to Help > About and confirm that your serial number is shown.
